## 1 Grow Tree towards Different Directions

## 2 Continuous and Discrete

## 3 Grow Three to the Right, Discrete and Continuous Muliple

There are three choices, choose consumption share first, which also means the residual goes to overall investment share.

1. **continous**, choose consumption, or aggregate investment, rightward bend span, three node, center longer to match bend

 $<sup>{\</sup>rm *https://fanwangecon.github.io,\ repository:\ } {\rm \underline{Tex4Econ}}$ 

- 2. **continous**, choose investment in capital, type 1 asset, residual goes to type two asset, rightward span, three node, center longer to match bend
- 3. **discrete**, within type 2 asset, choose a achieve the desired level of type two, rightward, five nodes, equi-distance

## 3.1 Nodes Only

When developing trees, to simply the problem, first just draw nodes and branches, no text, no benidng, no coloring.
